Topic: Divorce Attorney's web app	Author: Isaac Lopez	Date: 01/19/2021

Problem Background:

Due to the current situation the world is going through, many professionals that take clients in offices have been affected. This means a limit of clients per day affecting both clients and the professional. Divorce attorneys have the same problem, they are taking a limited amount of clients making the process a lot slower before the pandemic.

Countermeasures:

Provide a web application that takes care of the initial process and paperwork of a divorce. It should be easy for both the attorney and clients to get any relevant information needed, and any communication needed between them.

Target:

Simplify the divorce process by removing initial work.

Reduce any in-person or in-office communication.

Check/Evaluate:

Evaluate any similar web apps.

Develop initial models.

Causes:

Difficulty of determining "user-friendly".

May cause difficulty of integrating client-attorney communication.

Act/Standardize:

Determine best technology for example React+Express for web app and Heroku for hosting

Is this the best technology, should we use something that the whole group knows?
